

Revues.org, online humanities and social sciences portal

Revues.org is the longest standing platform for humanities and social sciences journals in France. Since 1999, it has been opened to quality periodicals looking to publish full-text articles online. More than 200 journals have already joined the platform in the domains of history, sociology, anthropology, geography, archaeology, political sciences, philosophy, literature, etc.

The platform is now run by the Centre for Open Electronic Publishing (Cléo), a unit that brings together the National Centre for Scientific Research (CNRS), the Graduate School of Social Sciences (EHESS), Provence University and Avignon University. The Cléo team is based in Marseille and Paris, and is made up of publishers, professionals in academic affairs, trainers, and IT application and web technologies specialists.

The creation of the Cléo, in 2007, has enabled the team to extend its services. It now offers a full range of solutions for electronic publishing and academic communication. Around Revues.org platform, *Calenda*, the social science calendar, and Hypothèses, the platform for humanities notebook, the Cléo has developed new tools to accompany the research and publishing processes at every stage, from managing ideas to research dissemination towards the academic community via selecting and publishing of texts.

While Revues.org was originally started to promote Francophone journals, today it also welcomes journals from outside France and journals produced, partly or totally, in other languages than French—English, Spanish, Portuguese, Basque... — a policy that has helped extend its reputation. Revues.org now has a high national and international profile and is in a position to offer member journals prime visibility.

Inter-operability

Since 2008, a collaboration has started between Cairn and Revues.org, as part of the **TGE Adonis** project. Today, the two platforms publish jointly 12 journals. In 2010 more than 20 journals will take part in this agreement. To ensure the continuity of collections between open-access articles published by Revues.org and restricted-access articles distributed by Cairn, the two platforms now offer combined browsing facilities. On both portals, readers can reach the table of contents of a whole journal collection. Full-text articles are accessible on the original portal via a simple click on the article title. Interoperability between the two platforms is already effective thanks to the use of the OAI-PMH Protocol and the sharing XML schema (METS, TEI and Dublin Core formats).
